The Fairchild Model 4800 volume booster is specifically designed to be used in conjunction with valve positioners on large control valve actuators to provide faster response than possible with the valve positioner alone. Deadband within the operation of the volume booster allows the positioner to make small incremental valve positioner changes in a highly stable manner without activating the volume booster valves. The integral bypass valve provides a means to control the response of the booster to match variations in valve positioner and actuator sizes.

**Features**

The Model 4800 volume booster is a rugged precision instrument with key features providing reliable, efficient and stable operation. These include:

- Fixed deadband between the operation of the supply valve and exhaust valve providing accurate and stable final positioning of the valve.
- Integral bypass needle valve to optimize response time and stability.
- Soft seat supply and exhaust valves provide efficient leak free operation and prevents hunting when used with modern electronic feed & bleed type positioners.
- Pressure balanced supply valve maintains deadband specification preventing changes in control characteristics when supply pressure changes.
- Damped diaphragm control chamber protects valves from damaging oscillation under high flow conditions.
- Two accessory ports connected to the outlet chamber provide convenient access to the outlet for additional control accessories and pressure monitoring.
- Tapped exhaust port for collecting exhaust air or for incorporation of a silencer.

**Operating Principles**

When signal pressure on the top of the Signal Diaphragm creates a downward force on the Diaphragm Assembly, the Supply Valve opens. Output pressure flows through the Outlet Port and the Aspirator Tube to the Control Chamber to create an upward force on the bottom of the Control Diaphragm. When the setpoint is reached, the force of the signal pressure that acts on the top of the Signal Diaphragm balances with the force of the output pressure that acts on the bottom of the Control Diaphragm to close the Supply Valve.

When the output pressure increases above the signal pressure, the Diaphragm Assembly moves upward to close the Supply Valve and open the Exhaust Valve. Because the Poppet Valve is closed, pressure flows down the connecting tube to the bottom of the Motor Diaphragm. This pressure keeps the Supply Valve tightly closed while in the exhaust mode. The Poppet Valve opens and exhaust output pressure exhausts through the vent in the side of the unit until it reaches the setpoint.

Hazardous Locations
Acceptable for use in Zones 1 and 2 for gas atmosphere; Groups IIA and IIB and Zones 21 and 22 for dust atmospheres

Materials of Construction
Body and Housing: Aluminum
Trim: Zinc Plated Steel, Brass
Diaphragm: Nitrile on Dacron
